

BlueParrott B250-XTS

What is Multipoint mode?

Multipoint Mode enables your headset to be paired and connected to two devices at the same time. It will monitor them both, and automatically switch to the active device when a call is received. Multipoint Mode is enabled by default in most BlueParrott headsets.

Note

If your headset is an Xpressway II or a B250-XTS, you will need to enable Multipoint Mode manually. Please refer to the product manual for further guidance.
